OPERATING MANUAL

TMH SERIES BULK POWER FRONT END

1.0 INTRODUCTION

This operating manual should be read through carefully before installing and operating the TMH Series hot-swap power systems.

The TMH Series hot-swap modules and rack form a bulk power front end with high-power outputs at 24, 28 or 48VDC See Figure 1. Each module has a 600-watt output: 24V at 25A, 28V at 21.4A or 48V at 12.5A. Three modules in a rack produce 24V at 75A, 28V at 62.4A or 48V at 37.5A. Using the three modules in a 2+1 redundant configuration produces 24V at 50A, 28V at 42.8A or 48V at 25A. The modules have single-wire active load sharing for automatic paralleling of outputs, and output ORing diodes permit hot-swap addition or replacement of modules while the system is operating.

The TMH Series operate worldwide with a 85-264VAC input range at 47-63Hz. Each module has input power factor correction and a Class B EMI filter. The output voltage is tightly regulated. There is a green AC power good LED and green DC power good LED on the front panel. Each module is self-cooled by an 80mm internal fan.

The TMH Series rack has two copper bus bars for the output and a 15-pin sub-miniature D connector on the back for the control functions: AC power good, DC power good, current share, enable and remote sense. There is also a 5V 100mA auxiliary output for powering external control circuits.

The hot-swap modules and racks are safety agency certified and CE marked.

2.0 FEATURES

The following is a summary of the important features of the TMH Series modules:

- For Distributed Power Systems
- Tightly Regulated Output Voltage
- 600-Watt Modules
- Output Overload Protected
- 24, 28 and 48VDC Versions
- Low Profile: 2U(3.47 inches or 88.1mm) Height

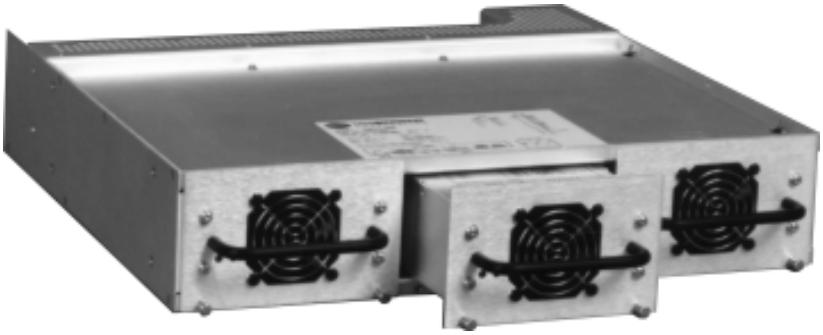

Figure 1. TMH Series Bulk Power Front End.

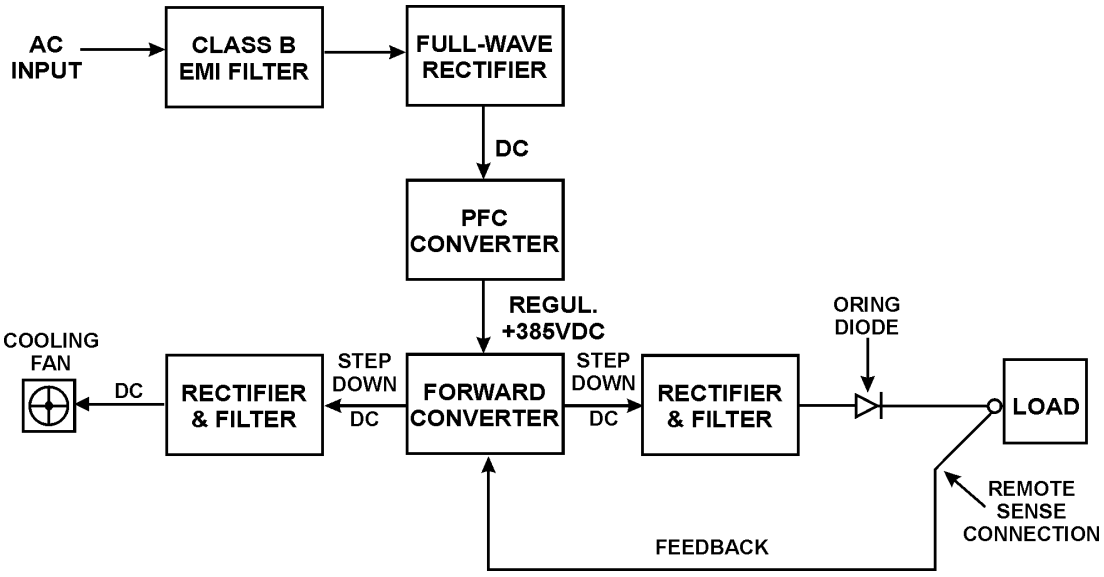

Figure 2. TMH Series Module Block Diagram.

- 19 -Inch Racks
- Rack Capacity Up to 3 Modules
- High Power Density: 4 Watts/Cubic Inch
- Light Weight: 4.75 lbs. per Module
- 85% Efficiency
- 0.99 Power Factor
- Class B EMI Input Filter
- Worldwide Input: 85-264 VAC at 47-63Hz
- 1200W Redundant or 1800W Non-Redundant
- Remote Sensing
- Active, Single-Wire Load Sharing
- Integral ORing Diodes
- Hot-Swappable Modules
- Front Panel Switch Option
- LED Operating Indicators
- Control and Monitoring Interface Signals

3.0 PRODUCT LINE

3.1 Hot-Swap Modules

MODEL	MAX. WATTS	OUTPUT VOLTAGE	MAX. OUTPUT CURRENT
TMH5000	600	24	25.0A
TMH6000	600	28	21.4A
TMH7000	600	48	12.5A

3.2 Racks

MODEL	WIDTH	HEIGHT	NUMBER OF MODULES
TMHR2U	19” (483MM)	3.47” (88MM)	3

3.3 System Rack Options

CODE	OPTION
A	Standard: 2-position terminal block connector for 1800W maximum output with 85-264VAC input.
B	Optional: IEC320 AC connector for 1200W maximum output with nominal 230VAC input only.

NOTE: Add Option Suffix Code to Model No.

4.0 SAFETY WARNINGS

4.1 These hot-swap modules and racks have hazardous external and internal voltages. They should be handled, tested and installed only by qualified technical persons who are trained in the use of power systems and are well aware of the hazards involved.

4.2 The input terminals are at hazardous voltage potentials. Do not touch this area when power is applied.

4.3 When operating this power system, the frame ground terminal must be connected to safety ground by means of a three-wire AC power line to minimize electrical shock hazard and to ensure low EMI (electromagnetic interference).

4.4 The internal voltages are at hazardous potentials. The module covers should not be removed. There are no user-serviceable components in these units. Removing the covers of the modules will void the warranty.

5.0 WARRANTY

All products of UNIPOWER Corporation are warranted for two (2) years from date of shipment against defects in material and workmanship. This warranty does not extend to products which have been opened, altered or repaired by persons other than persons authorized by the manufacturer or to products which become defective due to acts of God, negligence or the failure of customer to fully follow instructions with respect to installation, application or maintenance. This warranty is extended directly by the manufacturer to the buyer and is the sole warranty applicable. EXCEPT FOR THE FOREGOING EXPRESS WARRANTY, THE MANUFACTURER MAKES NO WARRANTY, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. As the sole and exclusive remedy under this warranty, the manufacturer, at its option, may repair or replace the non-conforming product or issue credit, provided the manufacturer's inspection establishes the existence of a defect. To exercise this remedy, the buyer must contact the manufacturer's Customer Service Department to obtain a Return Material Authorization number and shipping instructions. Products returned without prior authorization will be returned to buyer. All products returned for repair must be shipped freight prepaid to UNIPOWER. If the buyer fails to fully comply with the foregoing, the buyer agrees that no other remedy (including, but not limited to, incidental or consequential damages for lost profits, lost sales, injury to person or property or any other incidental or consequential losses) shall be available to the buyer.

6.0 UNPACKING AND INSPECTION

6.1 This TMH Series Power System was carefully tested, inspected and packaged for shipment from our factory. Upon receipt of the unit it should be carefully unpacked and inspected for any damage in shipment.

6.2 If there is evidence of damage, do not attempt to test the unit. The freight carrier should be notified immediately and a claim for the cost of the rectifier system should be filed with the carrier for direct reimbursement. Be sure to include the model and serial number of the damaged unit in all correspondence with the freight carrier. Also save the shipping carton and packing material as evidence of damage for the freight carrier's inspection.

6.3 UNIPOWER Corporation will cooperate fully in case of any shipping damage investigation.

6.4 Always save the packing materials for later use in shipping the unit. Never ship the rectifier system without proper packing.

7.0 DESCRIPTION OF OPERATION

7.1 Block Diagram. A diagram of a TMH Series Module is shown in Figure 2. The AC input first goes through a Class B EMI filter then to a full-wave rectifier and high-frequency (45kHz) power factor correction (PFC) converter. The output of the PFC converter is a regulated DC voltage at approximately +385V. This voltage is converted down to 24, 28 or 48VDC nominal, depending on the model. This is done by a forward converter operating at 150 kHz. The output of this converter goes through a rectifier, filter and ORing diode to the module output. Feedback from the remote sense terminals back to the forward converter pulse-width modulator regulates the output voltage and keeps it constant.

7.2 Power Factor Correction. This high-frequency converter circuit, switching at 45kHz, achieves a power factor of 0.99 by forcing the AC input current into a sinusoidal waveform, in phase with the input voltage. The input current is a smooth sine wave of much lower amplitude than the normal series of high-amplitude, input current pulses that are present in a unit without power factor correction. The result is lower RMS input current for a given output power level.

7.3 Cooling Fan. Another output from the forward converter is rectified, filtered and used to power the DC ball bearing cooling fan in the module.

7.4 Interface Signals. The module incorporates a number of interface control and supervisory signals which operate off internal circuits and are brought to the outside. These include remote enable, which enables or

inhibits the entire rack, and a current share connection which permits operating the rack in parallel with other racks for increased power. Other signals brought out of the rack for each module are AC good and DC good.

8.0 FRONT PANEL DESCRIPTION

The front panel of a TMH Series module is shown in Figure 3. On the left side of the panel are the AC Good LED (green) and DC Good LED (green). At the upper right of the 80mm cooling fan is an optional on/off switch.

9.0 TMH MODULE SPECIFICATIONS

Specifications for a Single Module. Typical at 115/230VAC Line, Full Load and 25°C Unless Otherwise Noted.

OUTPUT SPECIFICATIONS

Total Output Power, Max.	600 watts
Output Voltage, Fixed	24, 28 or 48VDC
Total Regulation[1]	1.0%
Ripple & Noise (Pk-Pk)[2]	1%
Hold-Up Time [3]	25mS
Dynamic Response[4]	300µS
Temperature Coefficient.	±0.02%/°C
Minimum Load.	0A
Overload Protection.	Foldback Current Limiting
Overvoltage Protection	Power Shutdown
Remote Sense	Up to 0.25V Per Wire

INPUT SPECIFICATIONS

Input Voltage Range	85-264VAC Single Phase
Power Factor	0.99
Input Frequency	47-63Hz
Inrush Limiting, Cold Start	30A Peak
Input Current, Full Load	6.7A, 120VAC
	3.5A, 230VAC
Input EMI Filter, Conducted	EN55022 Curve B
	FCC20780 pt. 15J Curve B
Harmonic Distortion	EN61000-3-2

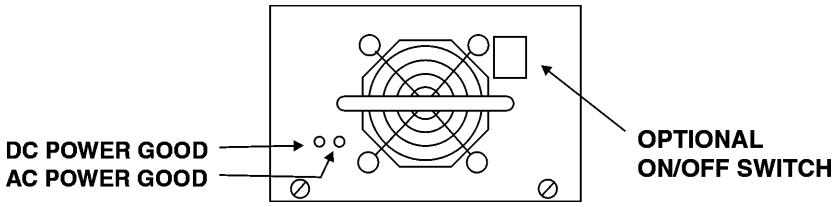

Figure 3. Front Panel of TMH Series Module

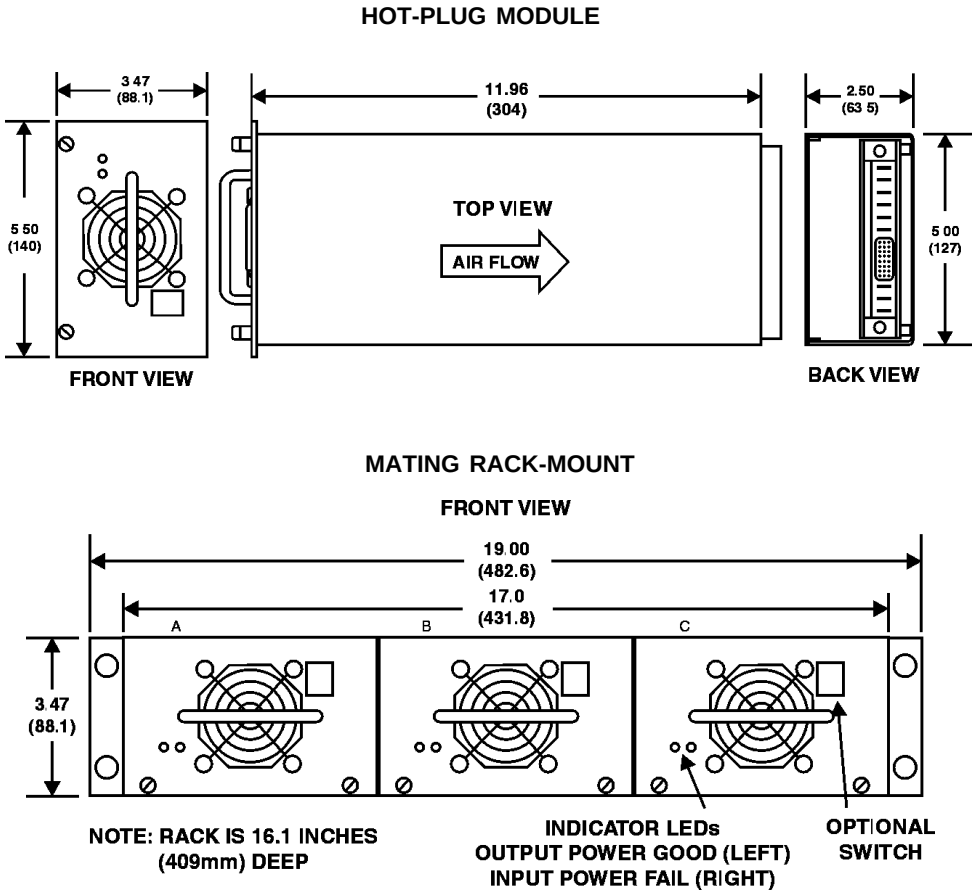

Figure 4. TMH Series Mechanical Dimensions

Input Immunity, Conducted
- Fast Transients, Line-Line ..... ±2kV (EN61000-4-4 Level 3)
- Surges, Line-Line ..... ±1kV (EN61000-4-5 Level 2)
- Surges, Line-Ground ..... ±2kV (EN61000-4-5 Level 3)

Input Protection ..... Internal Fuse, 10A

GENERAL SPECIFICATIONS

Efficiency ..... 85% at Full Load
Switching Frequency ..... 150kHz Nominal
Isolation, class I [5], min. ..... 3000VAC Input - Output
..... 1500VAC Input - Ground
..... 50VDC Output - Ground
Safety Standards EN60-950, UL1950, CSA22.2-950

ENVIRONMENTAL SPECIFICATIONS

Operating Temperature ..... 0°C to 70°C Ambient
Derating ..... 2.5% / °C, 50°C to 70°C
Storage Temperature ..... -40°C to +85°C
Cooling ..... Integral Ball Bearing Fan

PHYSICAL SPECIFICATIONS

Case Material ..... Aluminum
Dimensions, Inches (mm)
- Hot-Plug Module ..... 3.47 H x 5.50 W x 11.96 D
..... (88.1 x 140 x 11.96)
- 3-Module Rack ..... 3.47 H x 17.00 W x 16.10D
..... (88.1 x 432 x 409)

NOTES:

1. No Load to full load, including line regulation and load regulation.
2. 20MHz bandwidth. Measured with 0.1µF ceramic and 10µF tantalum capacitors in parallel across the output.
3. 600W output power at nominal AC line.
4. <4% deviation recovering to within 1% for 25% load change.
5. Input - output isolation figure is for isolation components only. 100% production Hipot tested.

10.0 DESCRIPTION OF FEATURES & OPTIONS

FEATURE / OPTION	DESCRIPTION
Power Factor Correction	The input current is a sine wave in-phase with the input voltage to give a power factor of 0.99. Input current total harmonic distortion meets EN61000-3-2.
Wide Range AC Input	The AC input range is continuous from 85 to 265VAC, 47-63Hz, for worldwide operation.
EMI Input Filter	This filter suppresses conducted noise from the module back onto the AC line. The filter meets FCC20780 part 15J Curve B and EN55022 Curve B.
Inrush Current Limiting	When the module is turned on from a cold start, the initial input current is limited to a peak value of 30 amperes.
Thermal Protection	If the output power converter overheats, the TMH module will automatically shut down. The DC Good LED also turns off. After a few minutes the module will cool and automatically start up again.
Current Sharing	The TMH modules are automatically connected to current share with each other when they are inserted into the rack. A single-wire connection provides this. The modules current share with an accuracy of 10% of their full load output current for total loads of 50% to 100%. The rack current share pin can be used to current share with another rack of the same output voltage.
ORing Diodes	This diode in series with each module output protects the parallel-connected modules. If the output of one module fails to a short or to a lower than normal output voltage, the other modules are not affected. Also when hot-swapping modules, the diode prevents a glitch in the output voltage while the output is still rising on the inserted module.
Overvoltage Protection	The output is protected from overvoltage due to fault conditions in the module. Overvoltage protection is set at approximately 29V for the 24V version, 34V for the 28V version and 59V for the 48V version. The result is a latched shutdown of the module. It is reset by cycling the AC input off for about 10 seconds and then back on.
No Load Operation	The module output can be operated down to zero load while maintaining output regulation.

FEATURE / OPTION	DESCRIPTION
Hot-Swap Connectors	The hot-swap connectors used in both the modules and racks are high-reliability connectors specifically designed for hot swap applications. They have staged pin lengths for safety and optimum operation. The ground (common) pin makes first contact and an interlock pin makes last contact, turning the module on (provided the rack is "enabled").
Hot Swap Operation	Hot swap operation means that the modules can be removed and replaced while the rack is powering the load. If the rack is operated in an N+1 redundant mode, hot-swap replacement will not affect the output voltage.
Output Protection	Output current limiting protects the output of each module from damage due to a dead battery or other short circuit condition. This protection is continuous, without damage, and recovery is automatic when the overload is removed. Current limiting begins at about 105% of rated output current.
LED Indicators	The AC Good indicator is a green LED, showing that input AC is present and that the PFC converter and internal control supply are operating. The DC Good indicator is a green LED showing that the output voltage is present and within operating range, and the fan is operating.
AC Input Options	There are two input versions: An IEC320 connector (option B) or a two-position terminal block for conduit connection. The terminal block is standard.
Control and Monitoring Signals	For detailed description of Remote Enable, Current Share, Remote Sense, AC Good and DC Good signals see Section 17, Description of Control and Supervisory Signals.

11.0 MECHANICAL SPECIFICATIONS

The mechanical dimensions of the TMH Series modules and rack are shown in Figure 4.

12.0 SAFETY AND INDUSTRY STANDARDS

12.1 The TMH modules and racks meet the following safety certifications:

STANDARD	AGENCY
UL1950	UL
CSA22.2-950	CUL
EN60-950	DEMKO

12.2 The TMH modules and racks are CE marked to indicate conformance to the European Union's Low Voltage Directive.

12.3 Input conducted EMI meets FCC20780 part 15J Curve B and EN55022 Curve B.

12.4 Input fast transient specifications meet EN61000-4-4 Level 3, input surges, line-to-line, meet EN61000-4-5 Level 2 and input surges, line-to-ground, meet EN61000-4-5 Level 3.

13.0 OPERATING INFORMATION

13.1 Input Voltage. The TMH Series modules operate off worldwide AC input voltages within the range of 85 to 264 VAC at 47 to 63 Hz. There are two AC input versions of the racks to chose from. The standard model has a two-position terminal block for a conduit cable connection. An optional version, Option B, has an IEC320 connector input. For complete details see Section 18.2 and Figure 5.

13.2 Output Connection. The 24V, 28V or 48V output is provided on two copper bus bars. Each bus bar has two 1/4-inch holes. Connection should be made by means of 1/4-inch diameter bolts. For complete details see Section 18.3 and Figure 5. Both positive and negative outputs are floating.

13.3 Output Voltage. The output voltage of each module is factory set to 24, 28 or 48 volts, ±1%.

13.4 Output Power. Maximum output current is 25A at 24 VDC, 21.4 at 28VDC or 12.5A at 48 VDC, giving a maximum output power of 600 watts. The maximum output power of a module may be drawn at up to 50°C ambient temperature. Above 50°C the output current must be derated by 2.5%/°C. See Figure 6. The maximum operating temperature is 70°C, at which the output current must be derated by 50%.

13.5 Output Overload Protection. Each module output is protected from damage due to overload or other short circuit condition. This protection is continuous and without damage; recovery is automatic when the overload or short is removed.

13.6 Remote Sensing. Remote sensing connections are made to pins 14 (+Sense) and 13 (-Sense) of the rack P3 connector. Remote sensing is used to regulate the output voltage at the point of load by compensating

REAR, TOP VIEW OF RACK-MOUNT

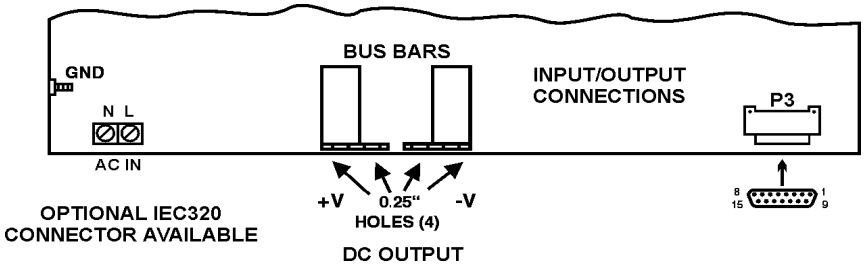

Figure 5. Rear Rack Input & Output Connections

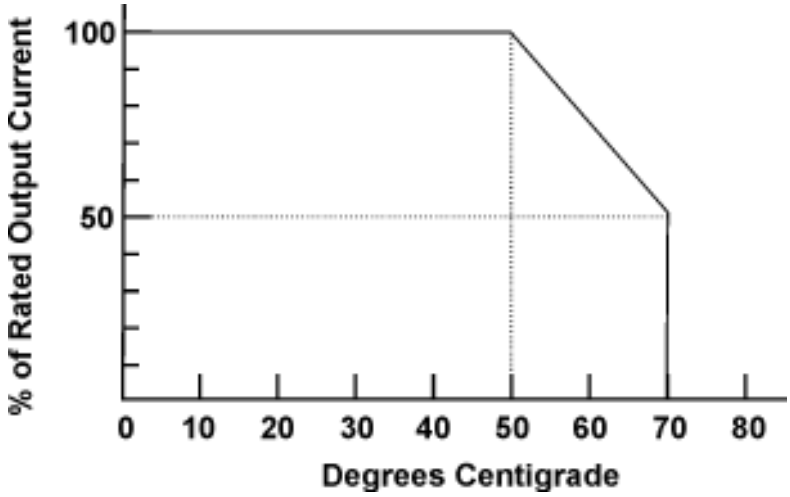

Figure 6. Rated Output Current vs. Ambient Temperature

for the voltage drop in the wires to the load. The +Sense lead must be connected to the + side of the load and the -Sense to the - side of the load. The sense leads should be a color-coded, twisted pair of AWG no. 22 or 24 copper wire. See Figure 7.

Remote sensing can compensate for a total voltage drop of 0.5V, or 0.25V per load wire. The sense leads should not exceed 10 feet (3 meters) in length. If remote sensing is not required, the sense leads may be left open for local sensing at the output terminals. Be careful not to reverse the sense lead connections.

13.7 Control & Supervisory Signals. All control and supervisory signals are accessible at P3, a 15-pin subminiature D connector on the back of the rack. See Section 17 for a complete description of these input and output signals.

13.8 Alarm Signals. Among the control and supervisory signals are two logic alarms for each module: AC Good and DC Good. They are TTL-compatible signals referenced to Signal Common, P3 Pin 11 on the rack. **AC Good:** A logic HI indicates that there is AC input and the PFC converter stage is operating. **DC Good:** A logic HI indicates a DC output is present and within operating range.

14.0 PARALLEL OPERATION

The TMH modules in the rack are all connected in the parallel, current sharing mode by means of a single-wire current share connection among them. A rack can be operated in either an N+1 redundant mode or a non-redundant mode.

14.1 Redundant Operation. From Table 14-1, the 19-inch rack mount can be operated in a 2+1 redundant mode. This means, for example, that the full load current must be carried by two rectifier modules. While operating normally the current is shared approximately equally among the three modules. If one module fails, however, the output current is then maintained by the two operating modules. The failed unit can be replaced without affecting the output current to the load. N+1 redundancy with quick replacement of a failed module results in virtually infinite MTBF.

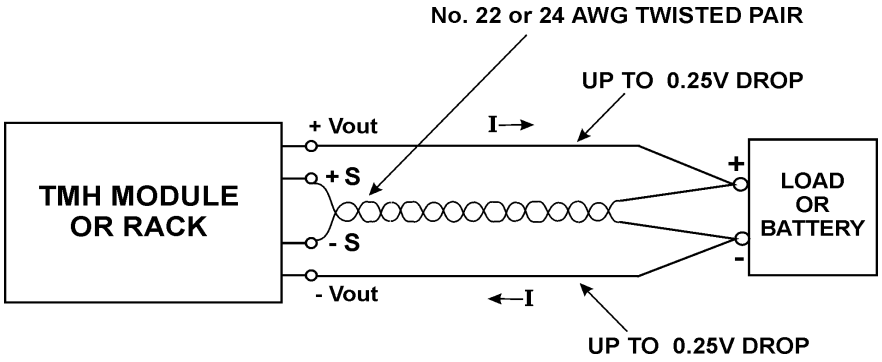

Figure 7. Remote Sensing Connection

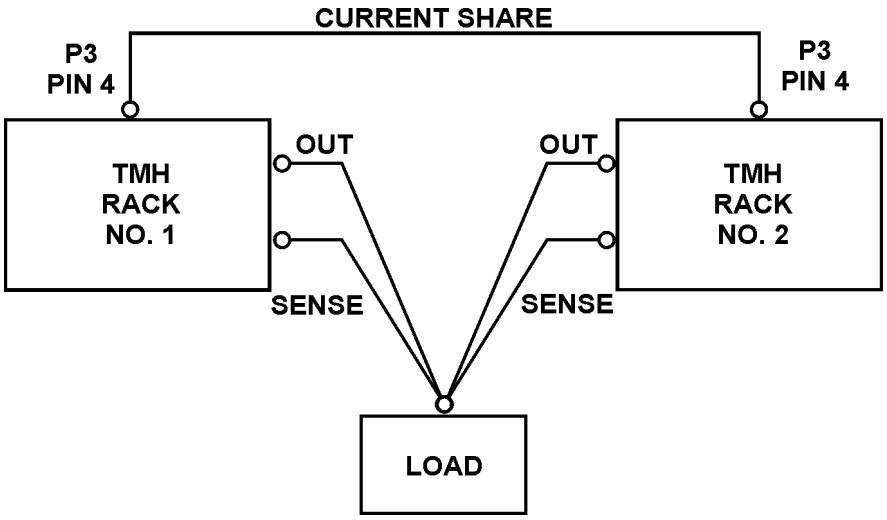

Figure 8. Parallel Connection of TMH Racks.

Table 14-1 Redundant and Non-Redundant Operation

MODE	NUMBER OF MODULES	NOM. VOLTS	AMPS MAX.
Redundant, 2+1	3	24	50
Non-Redundant	3	24	75
Redundant, 2+1	3	28	42.8
Non-Redundant	3	28	64.2
Redundant, 2+1	3	48	25
Non-Redundant	3	48	37.5

14.2 Non-Redundant Operation. Higher output current can be achieved by operating the rack in a non-redundant mode as seen in Table 14-1. However, in this case if a module fails, the load will lose power since only part of the required current can be supplied by the remaining modules, and they will go into current limit. The failed module, however, can be quickly replaced to restore the load current.

14.3 Multiple Parallel Rack Operation. Multiple racks can also be operated in parallel by interconnecting their current share terminals (P3 Pin 4). The total power can be expanded by several times. In this case N+1 redundant operation is achieved by reserving one module of the total for redundancy. For example, if two full 19-inch racks are employed with a total of six modules, then 5+1 redundancy is achieved and the full load must be able to be carried by the output of five modules. In such applications each set of remote sense wires must be separately connected to the point of load. See Figure 8 for a simplified illustration of two TMH racks connected in parallel.

15.0 RACK CONTROL & SUPERVISORY SIGNAL CONNECTIONS

15.1 Connections for control and supervisory signals are made at the back of the rack to connector P3, a standard 15-pin subminiature D connector (AMP AMPLIMATE No. 747845). The mating connector is AMP AMPLIMATE No. 747908-2.

15.2 The pin connections to P3 are shown in the table.

RACK MOUNT P3 SIGNAL CONNECTOR

PIN	FUNCTION	PIN	FUNCTION	PIN	FUNCTION
1	AC Power Fail-C	6	DC Power Good-B	11	Signal Common
2	AC Power Fail-B	7	DC Power Good-A	12	5V, 100mA Aux.
3	AC Power Fail-A	8	Enable-C	13	- Sense
4	Current Share	9	Enable-B	14	+ Sense
5	DC Power Good-C	10	Enable-A	15	Not Used

NOTE: A, B and C refer to the module position from left to right, viewed from the front of the rack.

P3

Standard subminiature D connector AMP AMPLIMATE No. 747845

16.0 TMH MODULE CONNECTIONS

If the TMH module or modules are used separately from the rack or in a user configured rack, connections should be made to the high-reliability hot-swap connector on the back of the module with the functions as shown in Figure 9.

17.0 DESCRIPTION OF CONTROL AND SUPERVISORY SIGNALS

SIGNAL	PINS	DESCRIPTION
AC Good - C AC Good - B AC Good - A	1 2 3	These are TTL outputs for each corresponding module. A TTL HI indicates the AC input is present and the PFC converter stage has output. A TTL LO (sinking 5mA) indicates AC input or PFC converter failure. This signal is referenced to Signal Common, Pin 11.
Current Share	4	This is an analog control signal made up of the current share signals of all rack modules connected together. This pin is used to connect to Pin 4 of another identical TMH rack to share output currents. Output currents between racks are shared within an accuracy of 10% of full load current over a 50% to 100% load range. This signal is referenced to Signal Common, Pin 11.
DC Good - C DC Good - B DC Good - A	5 6 7	These are TTL outputs for each corresponding module. A TTL HI indicates that the module is operating properly with output voltage in its controllable range. A TTL LO (sinking 5mA) indicates output failure or cooling fan failure. This signal is referenced to Signal Common, Pin 11.
Remote Enable	8, 9, 10	A TTL HI or open at each input enables (turns on) the corresponding module in the rack. A TTL LO (sinking 2mA) inhibits (turns off) each module.This input is referenced to Signal Common, Pin 11.
Signal Common	11	This is the reference common for the Remote Enable, AC Good and DC Good signals. It is internally in common with the -Sense, Pin 23.
Auxiliary Supply	12	This is a +5VDC auxiliary output at 100mA for powering external control and supervisory circuits. The return is the Signal Common, Pin 11.
- Sense + Sense	13 14	These remote sense leads should be connected as a twisted pair to the respective + and - load points to provide regulation at the point of load.

TMH MODULE CONNECTOR

12	AC Power Fail	22	+ Sense

NOTE: All other pins are No Connection.

Figure 9. TMH Series Module Connections

18.0 INSTALLATION

18.1 Mounting. See Figure 4. The TMH Series chassis is mounted in a rack by means of mounting brackets on each side of the chassis. When mounting, the chassis should first be securely mounted to the rack, then the modules should be inserted into the chassis. The modules are secured by tightening the captive screws at the bottom of each module.

18.2 AC Input Connections. There are two AC input versions of the TMH racks. See Figure 5. The standard version is for a conduit cable connection to a two-terminal barrier strip. Ground connection is made to the chassis by means of the no. 8-32 stud shown in the diagram. The optional version (Option B) uses an IEC320 connector for a power cord.

18.3 DC Output Connections. The DC output connections are shown in Figure 5. The positive and negative output connections are made to the copper bus bars as shown. The left bar is positive and the right one negative. Each bar has two ¼ - inch holes. Connection to the bus bars should be made by means of ¼ - inch bolts. The output wires should be sized in accordance with the load current and length of conductor.

18.4 Contact Resistance. The connecting wires or lugs should be clean, and a tight, firm connection should be made to the output bus bars to minimize contact resistance.

18.5 Control and Supervisory Signal Connections. These connections are made to P3, a subminiature D 15-pin connector (AMP AMPLIMATE No. 747845), by means of the mating connector. Details for these connections are given in Sections 15.1 and 15.2.

18.6 Cooling. Each TMH module is cooled by an 80mm, internal DC ball bearing fan. For proper cooling the area in front of the fan and around the air exits should be kept clear for unimpeded air flow.

19.0 MAINTENANCE

No routine maintenance is required on the TMH Series except for periodic cleaning of dust and dirt around the fans and the ventilation holes. A small vacuum nozzle should be used for this.

20.0 TMH MODULES AND RACK SETUP AND TESTING

20.1 The TMH modules and rack can be initially tested mounted in a rack or on a test bench. The power system is initially tested one module at a time in the rack.

20.2 Connect an AC conduit cable to the proper terminals on the input terminal block and the safety ground wire to the 8-32 ground stud. Or, for the optional version of the rack, connect a three-wire power line to the IEC320 connector on the back of the rack. Do not plug the AC line into the power socket yet.

20.3 Connect a resistive power load across the DC output terminals. This load can be a DC electronic load that is set to the resistive mode or a high-power resistor that has the proper power capacity and cooling. For this test the load should be between about 10% and 50% of the full load rating of the module. For the 24V module the resistor should be between 1.9 and 9.6 ohms; for the 28V module it should be between 2.6 and 13 ohms; and for the 48V module it should be between 7.7 and 38 ohms.

20.4 Connect a color-coded, twisted pair (no. 22 or 24 AWG) from the remote sense pins to the load. The +Sense lead (P3 Pin 14) **must go** to the positive side of the load and the - Sense lead (P3 Pin 13) **must go** to the negative side of the load. The Remote Enable input (P3 Pin 10) should be open.

20.5 Insert one of the TMH modules into position A of the rack (leftmost slot). Plug the AC power in and measure the voltage across the load at the remote sense points with a digital voltmeter. The voltage should be at the rated output voltage of the module, i.e., 24, 28 or 48V, ±1%.

20.6 **Checking the Front Panel LEDs**. The AC Good and DC Good LEDs should both be green.

20.7 **Checking the Remote Enable Input.** Next, connect a Remote Enable wire from P3 Pin 10 to Pin 11. The module output should turn off, giving zero volts across the load. The DC Good LED should go off. Disconnect the Remote Enable wire.

20.8 **Checking the AC Good and DC Good Outputs**. Measure the voltage from P3, Pin 3 to Pin 11 and Pin 7 to Pin 11 with a digital voltmeter. Both

voltages should be less than +0.5V, indicating a TTL LO.

Reconnect the Remote Enable wire from Pin 10 to Pin 11. Measure the output voltage at both P3 Pins 3 and 7 with respect to Signal Common (Pin 11) with a digital voltmeter. Pin 3 should be at a TTL HI, or about +5V. Pin 7 should be at a TTL LO, or less than +0.5V. Disconnect the Remote Enable wire. Unplug the AC input to the TMH rack.

20.9 Checking the Other TMH Modules. Each module should be tested in the above manner to verify its operation. Go back to Section 20.5 and proceed through the tests one by one until all modules have been verified.

20.10 Checking the Complete TMH Rack. Confirm that the output voltages of the individual modules are all accurately set to 24, 28 or 48V. The voltages between modules should be within ±1% of each other for best performance of the current sharing circuitry. Insert all modules into the rack. Connect a power load - - high-power resistor or electronic load in resistive mode -- in accordance with the table, to the output of the rack. Connect the + and - Sense leads to + and - sides of the load, respectively, as in Section 20.4. Plug the rack into the AC power source.

Table 20-1 TMH Rack Loads For Test

NO. OF MODULES	OUTPUT VOLTAGE	LOAD CURRENT	LOAD RESISTOR
3	24	40-50A	0.50 - 0.60Ω
3	28	34-42A	0.67 - 0.82Ω
3	48	20-25A	1.92 - 2.40Ω

Check the load voltage with a digital voltmeter. It should be very close to 24, 28 or 48VDC (±1%), depending on the model tested. The AC Good and DC Good LEDs should both be green on each module.

While the rack is operating, pull Module A out while monitoring the output voltage with a digital voltmeter. It should remain the same. Insert the module back into the rack. Repeat this for each of the other modules. This test determines that hot-swapping is functioning properly in the N+1 redundant mode.

With all the modules inserted into the rack, check the Enable input for the entire rack. Connect Remote Enable wires from P3, Pins 8, 9 and 10 to Pin 11. The rack output should turn off and the output voltage should go to zero.

Disconnect the Remote Enable wires. This completes the rack setup and testing.

21.0 TROUBLESHOOTING GUIDE

21.1 If you encounter difficulties in getting the modules or complete rack to operate properly, go through the following troubleshooting guide.

21.2 Table 21-1. TMH Module and Rack Troubleshooting

SYMPTOM	POSSIBLE CAUSE	ACTION TO TAKE
No output, AC Good and DC Good LEDs off.	No input power.	Check connection to AC source. Check AC source circuit breakers.
No output, DC Good LED off, AC Good LED on.	Remote Enable in OFF mode.	Make sure P3 Pins 8, 9 and 10 (Remote Enable) are open or at TTL HI.
No output, DC Good LED off, AC Good LED on.	Shorted output.	Check for short and remove.
No output, DC Good LED off, AC Good LED on.	Overvoltage protection (OVP) has latched.	Reset output by cycling the AC input OFF for 10 seconds and then back ON.
No output, DC Good LED off, AC Good LED on.	Overtemperature protection is activated on one or more modules.	Allow modules to cool down for about 10 minutes. They will then start up automatically. Check to see if the cooling fans are operating.
No output, DC Good LED off, AC Good LED on.	Output load is too great for the number of modules.	Reduce load to proper level.

21.3 If none of the above actions solves the problem, call UNIPOWER Corporation at 954-346-2442 Ext. 400 for help and try to resolve the problem over the telephone.
